My Written Reflexion:

1. The biggest issue was the navigation and the cards. The nav links were inline-block with a 24px margin, so on a phone they got cramped, and the 80% wide cards left awkward empty space.
2. I added a centered container for the header, main, and footer with a max-width of 960px, and kept box-sizing: border-box. For images I used max-width: 100% and height: auto. Then I wrote a media query at 600px that stacks the nav links and makes the cards 100% wide.
3. On wide screens the content stays in a centered column. On narrow screens everything goes into one column, the links stack, and I didn't need to scroll sideways.
4. I learned that a page can look fine on my laptop and still feel off on a phone. Testing at 1280, 768, and 390 showed me things I wouldn't have noticed otherwise.
5. Next I'd add a second media query for tablets around 768px, and maybe a collapsible menu for the nav. I'm not totally sure what the best breakpoint is yet.
