My Written Reflexion:

The most useful selector was the .about-image class, along with the img selector. The img selector made my images responsive with max-width: 100%, and .about-image let me center and size the two images on my about page.

Margin is the space outside an element that pushes other things away. Padding is the space inside an element, between the content and the border.

The box model explained why my images were touching the text. When I added margin: 15px 0 and some padding, the page had room to breathe and looked cleaner.

Yes. My img rule and my .about-image rule were both styling the same images. The class rule won where they conflicted, because a class is more specific than an element selector, so it overrode the img rule.

Fixing my image paths and adding max-width: 100%, display: block, and margin auto improved my site the most. My broken question-mark icons turned into centered, responsive images that fit my UN Human Rights theme.
